Abstract (Basic): SU 1810324 A

Ethylene glycol is reacted with tetrafluoro- or tri:fluoro-chloro-ethylenes in a medium of ethylene glycol derivs. e.g. diglyme with potassium or sodium hydroxide catalyst and quat. ammonium salts to yield poly:fluoroalkyl esters of ethylene glycol of formula $(RFHCCF_2OCH_2)_2$ where R is F or Cl. The quat. ammonium salts have the formula $(R_1)_3R_2N(+)X(-)$, where R_1 is 2-4C alkyl, R_2 is CH_2Ph or R_1 and X is Br or Cl. The molar ratio of ethylene glycol, hydroxide, ammonium salt and solvent is 1:0.14-0.4:0.01-0.05:1.0-6.0.

USE/ADVANTAGE - Used as solvents and intermediate cpds. The yield and rapidity of process are improved. In an example of the prepn. of bis(1,1,2,2-tetrafluoro)ethyl ether of ethyleneglycol, 3.1 g. of ethylene glycol, 27 g. of diglyme, 0.56 g. of powdered caustic soda and 0.26 g. of triethylbenzylammonium chloride were mixed to complete soln. Tetrafluoroethylene was bubbled through at 1 l/h. at 55-60 deg.C, After 2 hrs. the same quantities of soda and ammonium salt were again added and the reaction continued for 1 hr. 8.9 g. of olefin were absorbed. After pouring into water, sepn. of the lower layer, rinsing with water and sulphuric acid, drying and distn. 10.2 g. of prod. were obtd.
